# Introduction

To explore behavioural shifts as well as enclosure space-use between kangaroos with the introduction of two different species of wallabies.

# Methods

The formula for deriving the Shannon's Diversity Index (SDI) is as follow:

$$SDI = - \sum_{i=1}^B p_i \times \ln p_i$$

where  $B$  is the number of behaviour types ( $n = \leq 11$ ) and  $p_i$  is the proportion of behaviour  $i$ . Greater index values demonstrates a greater diversity in exhibited behaviour and index values increases linearly with number of behaviour types and abundances.

# Results

- NVs are removed. They compose nearly 9 – 16% across all individuals.
- Behaviours that occur less than 1% of the time are also removed.
